Can Li-ion battery chemistry be used for stationary grid energy storage?

Apart from Li-ion battery chemistry, there are several potential chemistries that can be used for stationary grid energy storage applications. A discussion on the chemistry and potential risks will be provided.

How should a lithium battery container be segregated?

This allows for crew access for boundary cooling with fire hoses and permits flammable gases to vent to the atmosphere. Segregation: It is recommended to segregate lithium battery containers from those containing other dangerous goods, particularly flammables, by at least one container bay (6 meters).

What are the risks associated with the carriage of lithium-ion batteries?

The primary risk associated with the carriage of lithium-ion batteries is thermal runaway. This is a chemical reaction in which an increase in temperature within a battery cell causes a further, uncontrolled increase in temperature. This process can be initiated by manufacturing defects, physical damage, or overcharging. The consequences include:

What are the new packaging requirements for lithium ion batteries?

Revised Packing Instructions: More stringent requirements for UN-certified packaging, capable of withstanding specific drop tests. State of Charge (SoC) Emphasis: Increased scrutiny on the SoC for standalone lithium-ion battery shipments, with a general requirement not to exceed 30% of rated capacity.
