What is a temperature cycling chamber?

For example, our benchtop and Platinous series chambers can do temperature cycling tests ranging from 70 to 20 to -40°C with 30-minute transitions. These chambers enable manufacturers to evaluate the battery's performance under extreme temperatures and temperature-related stress.

What is temperature cycling?

Temperature cycling involves subjecting the battery to repeated cycles of extremely high and low temperatures, meanwhile the batteries are monitored to evaluate the battery's response to the hot or cold conditions, ensuring it meets minimum safety, reliability, and longevity standards.

Why do lithium ion batteries need a temperature cycling test?

Safety: Temperature cycling tests help identify potential safety hazards associated with lithium-ion batteries, such as thermal runaway or internal short circuits. Batteries that pass temperature cycling tests demonstrate robust safety features and are less prone to malfunctions or accidents.

What is the temperature range of a battery?

1. Temperature Range: Batteries are subjected to a predefined temperature range, typically fluctuating from extreme cold to extreme heat. This range varies depending on the application and industry standards but commonly spans from below freezing (-40°C or lower) to elevated temperatures (up to 70°C or higher).

The primary objective of temperature cycle testing is to accurately simulate the working conditions of the battery system in an environment with temperature fluctuations.

Temperature extremes greatly reduce lead-acid based battery performance and shorten battery life. Therefore, it is important to maintain the cabinet temperature within the ...
