---

Here, we give a brief review of recent progress in the modification methods of carbonous felt electrodes, such as surface treatment, the deposition of low-cost metal oxides, ...

Several characterization techniques were used to deepen the understanding of the treatment of carbon felt to study the interplay of electrode structure, wettability, and ...

Flow batteries possess several attractive features including long cycle life, flexible design, ease of scaling up, and high safety. They are considered an excellent choice for large-scale...

Surface modification of carbon felt with high conductivity, thermal stability, and specific surface area of carbon nanotubes can effectively improve the overall conductivity, thermal stability, ...

battery felt for redox flow batteries. The innovative electrode material, marketed under the name SIGRACELL(R) GFX4.8 EA\*, is characterized by its low electrical resistance and therefore ...

The orientation of carbon felt electrodes in redox flow batteries is found to influence battery performance due to the differences in electrode activity between each face of the ...

Due to the increased reactivity of vanadium ions on the treated carbon felt, the all-vanadium flow battery with plasma-modified carbon felt has much higher efficiency and shows better capacity ...

Here, we report a surface engineered carbon felt with abundant carbon defects, which realizes highly reversible Fe deposition/dissolution for all-iron flow batteries.

Battery carbon and graphite felt are critical components in advanced energy storage systems. They serve as conductive, lightweight, and durable materials that enhance ...

In this study, a carbon felt (CF) electrode with numerous nanopores and robust oxygen-containing functional groups at its edge sites is designed to improve the ...
